Cookie Data Report

Introduction:-

The purpose of this report is to analyse the sales data of various cookie types across different countries for the years 2019 and 2020. The dataset provides insights into revenue, profit, quantity sold, and pricing information for each cookie type and country. Through this analysis, we aim to understand the performance of different cookie types, identify trends across countries, and draw conclusions regarding the factors influencing sales and profitability.

Questionnaire:-

1. Compare the profit earn by all cookie types in US, Malaysia and India.
2. What is the average revenue generated by different types of cookies?
3. Which country sold most Fortune and sugar cookies in 2019 and in 2020?
4. Compare the performance of all the countries for the year 2019 to 2020. Which country perform in each of these years?
5. Which cookie category sold on the highest price, country wise and how much profit is earned by that category overall?

Analytics:-

1. Compare the profit earn by all cookie types in US, Malaysia and India.

Ans: The profit from chocolate chip cookies in these countries is higher than that of other cookies, including fortune cookies, oatmeal raisin, and white chocolate macadamia.

2. What is the average revenue generated by different types of cookies?

Ans: From the chart above, it's clear that white chocolate macadamia nut cookies generate more revenue on average than all other types. However, oatmeal cookies come in as the second highest revenue generating variety.

3. Which country sold most Fortune and sugar cookies in 2019 and in 2020?

Ans: According to the above graph, India had the highest sales of sugar and fortune cookies in 2020, followed by the United States. In 2019, the United Kingdom and the Philippines also sold sugar and fortune cookies.

4. Compare the performance of all the countries for the year 2019 to 2020. Which country perform in each of these years?

Ans: In the year 2020, an analysis of the performance of all countries showed that the United Kingdom had the most superior performance. This was a notable achievement for the country. However, in the preceding year, 2019, it was India that took the lead, showcasing a strong performance compared to other countries.

- Which cookie category sold on the highest price, country wise and how much profit is earned by that category overall?

Ans: In the United States, chocolate chip cookies accounted for the highest sales, contributing to 23% of total profit, while in India, they represented 22% of the profit.

Conclusion and Reviews: -

In conclusion, analyzing cookie sales data has provided valuable insights into customer preferences, market trends, and profitability across various countries and types of cookies. By examining revenue, profit, volume sold, and price data, we gained a comprehensive understanding of the factors affecting sales. This research

has enabled us to boost profitability and better meet customer needs by identifying growth opportunities, refining product offerings, and adjusting our marketing strategies. To maintain a competitive edge in the ever-changing cookie market, we must continue to research and adapt based on these insights. Overall, this careful analysis of sales data is crucial for making strategic decisions and ensuring the long-term success of our cookie business.

Regression:

The regression model, with a significant p-value ($p < 0.001$), indicates a strong positive relationship between the predictor variable, units sold, and the outcome variable. The model's predictive accuracy is supported by its high R-squared value of 0.688, suggesting that approximately 68.8% of the variability in the outcome variable can be explained by units sold.

SUMMARY OUTPUT

Regression Statistics	
Multiple R	0.829304
R Square	0.687746
Adjusted R Square	0.687298
Standard Error	1462.76
Observations	700

ANOVA

	<i>df</i>	<i>SS</i>	<i>MS</i>	<i>F</i>	<i>Significance F</i>
Regression	1	3.29E+09	3.29E+09	1537.356	1.4E-178
Residual	698	1.49E+09	2139668		
Total	699	4.78E+09			

	<i>Coefficients</i>	<i>Standard Error</i>	<i>t Stat</i>	<i>P-value</i>	<i>Lower 95%</i>	<i>Upper 95%</i>	<i>Lower 95.0%</i>	<i>Upper 95.0%</i>
Intercept	-74.4103	116.5304	-0.63855	0.523326	-303.202	154.3817	-303.202	154.3817
Units Sold	2.500792	0.063781	39.20914	1.4E-178	2.375567	2.626017	2.375567	2.626017

Co-relation:

In our analysis, the correlation coefficient, a statistical measure that calculates the strength of the relationship between the relative movements of two variables, between the number of units sold and the total revenue generated is calculated to be 0.796. This value lies close to 1, indicating a strong positive correlation between the two variables. This means, as the number of units sold increases, the total revenue generated also increases, and vice versa. This relationship is significant in predicting future sales performance and revenue.

	<i>Units Sold</i>	<i>Revenue</i>
Units		
Sold	1	0.796298
Revenue	0.796298	1

Anova (Single Factor) :

The AN VA results indicate a significant difference between the two groups ($p < 0.001$), with 1 degree of freedom. The within-group error is 7681356717, and the total R-squared value is 0.06, suggesting that the model explains 6% of the variability in the data.

SUMMARY

<i>Groups</i>	<i>Count</i>	<i>Sum</i>	<i>Average</i>	<i>Variance</i>
3450	699	1923505	2751.795	4154648
5175	699	2758189	3945.908	6850161

ANOVA

<i>Source Variation</i>	<i>of SS</i>	<i>Df</i>	<i>MS</i>	<i>F</i>	<i>P-value</i>	<i>F crit</i>
Between Groups	4.98E+08	1	4.98E+08	90.57022	7.53E-21	3.848129
Within Groups	7.68E+09	1396	5502405			
Total	8.18E+09	1397				

Anova two factor without Replication:

The AN VA results reveal significant variation among rows and columns ($p < 0.001$), with degrees of freedom (df) values of 48 and 3, respectively. The error term has a degree of freedom of 144.

ANOVA

<i>Source</i>	<i>of</i>
---------------	-----------

<i>Variation</i>	<i>SS</i>	<i>Df</i>	<i>MS</i>	<i>F</i>	<i>P-value</i>	<i>F crit</i>
Rows	8.21E+08	48	17108242	5.848894	8.54E-17	1.445925
Columns	5.65E+10	3	1.88E+10	6435.486	3.8E-153	2.667443
Error	4.21E+08	144	2925039			
Total	5.77E+10	195				

Anova two factor with Replication:

The AN VA results show that there is a significant difference among the samples, columns, and their interaction, with p-values less than 0.001. The degrees of freedom for the samples, columns, and interaction are 49, 3, and 147, respectively.

Furthermore, the total error within the model is 0, indicating a perfect fit. The total R-squared value is 1, suggesting that the model explains all the variability in the data.

ANOVA

Store Data Report

Introduction:

This dataset encompasses sales data from a retail store, featuring a range of attributes including customer demographics (Gender, Age Group), transaction details (Order ID, Status), product specifics (Category, SKU), and shipping information. With a focus on understanding customer behaviour and product trends, our analysis aims to uncover patterns, preferences, and correlations within the data. By leveraging these insights, businesses can optimize marketing efforts, enhance inventory management, and improve customer satisfaction.

Questionnaire:

1. which of the channel performed better than all other channels in compare men & women?
2. Compare category. Find out most sold category above 23 years of age for any gender.
3. Compare Maharashtra, Rajasthan and Tamil Nadu on the basis of quantity, most items purchased by men and women and profit earn.
4. Which city sold most of following categories:
 - a. Kurta
 - b. Set
 - c. Western wears
5. In which month most items sold in any of the state on the basis of category.

Analytics:

1. which of the channel performed better than all other channels in compare men & women?

Ans: Amazon leads in sales for both men and women, followed by Myntra and Flipkart. Amazon sold nearly 3500 units in the men's category and about 7500 units in the women's category. Myntra sold 2000 units in the men's division.

2. Compare category. Find out most sold category above 23 years of age for any gender.

Below is the sales table:

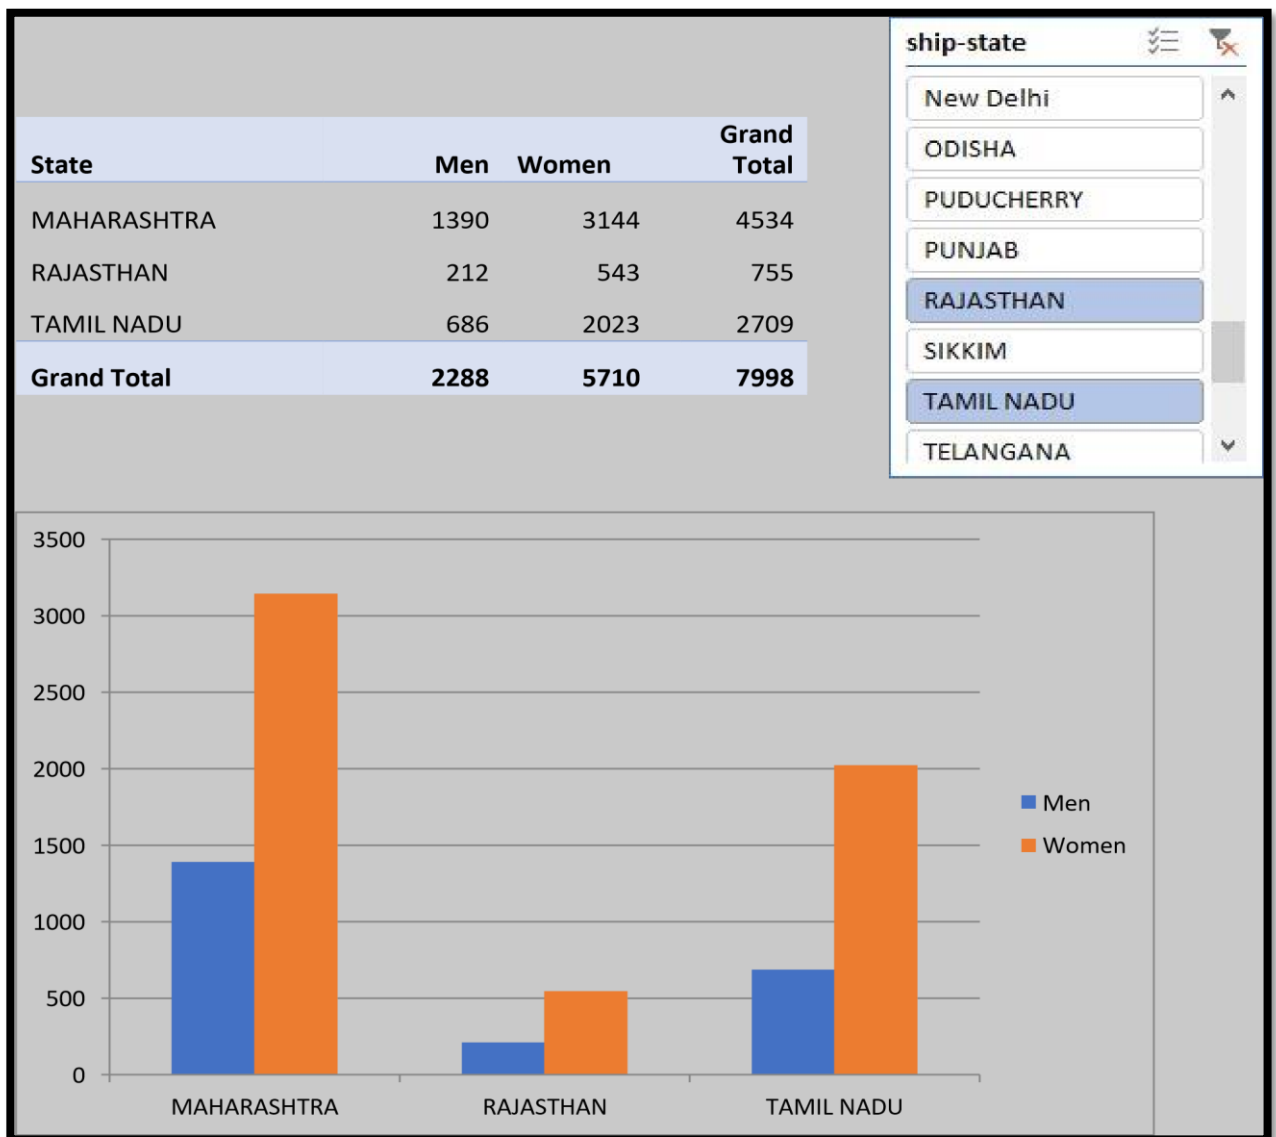

Item	Men	Women	Grand Total
Blouse	6	190	196
Bottom	40	28	68
Ethnic Dress	150	77	227
kurta	156	8820	8976
Saree	261	941	1202
Set	4365	6204	10569
Top	45	1825	1870
Western Dress	3078	380	3458
Grand Total	8101	18465	26566

The graph is as follows:

Ans 8820 kurta pieces were sold in the women's category for those over 23, making it the top-selling item. In the men's category, sets sold 4365 units, making them the most in-demand items. Additionally, sets are the second most sold item in the women's category.

3. Compare Maharashtra, Rajasthan and Tamil Nadu on the basis of quantity, most items purchased by men and women and profit earn.

Ans:

- In Maharashtra, sales in the men's category were 1390, while sales in the women's category reached 3144.
- In Tamil Nadu, sales in the men's category amounted to 686, compared to 2023 in the women's category.
- In Rajasthan, the men's category registered 21 sales, while the women's category had 543 sales.

4. Which city sold most of following categories
 - a. Kurta
 - b. Set
 - c. Western wears

Ans: In terms of apparel sales within India, Bengaluru, Chennai, Hyderabad, Mumbai, and New Delhi stand out significantly. These cities record the highest number of purchases for items such as kurtas, sets, and western wear. These garments are evidently incredibly popular among the residents of these cities, contributing to a large volume of their fashion retail industry.

5. In which month most items sold in any of the state on the basis of category.

City	kurta		Set	Western Dress	Grand Total
BENGALURU		964	938	422	2324
CHENNAI		666	451	217	1334
HYDERABAD		713	687	370	1770
MUMBAI		437	515	207	1159
NEW DELHI		479	792	142	1413
Grand Total		3259	3383	1358	8000

Category

Blouse

Bottom

Ethnic Dress

kurta

Saree

Set

Top

Western Dress

Ans: The graph for most items sold in any of stats on basis of category is as follows:

Conclusion and Review:

After a thorough analysis of the store data, it's clear that there are significant trends and insights to consider. By examining key metrics like units sold, state-wise analytics, geographic data, and sales across different stats and products, we can form useful conclusions about market demand, sales, and overall profitability. This comprehensive understanding will aid in making informed decisions to optimize resources, target certain markets, and maximize profits in future sales efforts.

Car Collection Report

Introduction:-

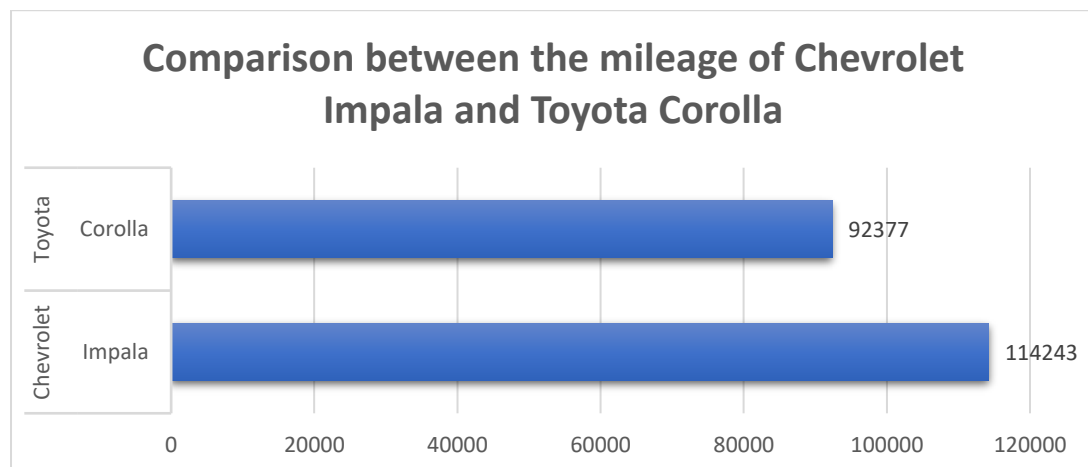

This report provides an in-depth analysis of a dataset containing information on various makes and models of used vehicles. The data encompasses details such as the make, model, color, mileage, listing price, and estimated cost for 24 different vehicles spanning popular brands like Honda, Toyota, Nissan, Ford, Chevrolet, and Dodge. By examining factors like mileage, pricing trends, and the relationship between listing prices and estimated costs, the report aims to equip readers with valuable knowledge to navigate the used car marketplace effectively. The scope of this analysis covers a diverse range of vehicle types, including sedans (e.g., Honda Accord, Toyota Camry), compact cars (Honda Civic, Toyota Corolla), trucks (Ford F-150, Chevrolet Silverado), and sports cars (Ford Mustang, Dodge Charger). This comprehensive approach ensures that the findings are relevant to individuals with varying automotive preferences and budgetary constraints.

Questionnaire:-

1. Compare the mileage of Chevrolet Impala to Toyota Corolla. Which of the two is giving best mileage?
2. Justify, Buying of any Ford car is better than Honda.
3. Among all the cars which car color is the most popular and is least popular?
4. Compare all the cars which are of silver color to the green color in terms of Mileage.
5. Find out all the cars, and their total cost which is more than \$2000?

Analytics:-

1. Compare the mileage of Chevrolet Impala to Toyota Corolla. Which of the two is giving best mileage?

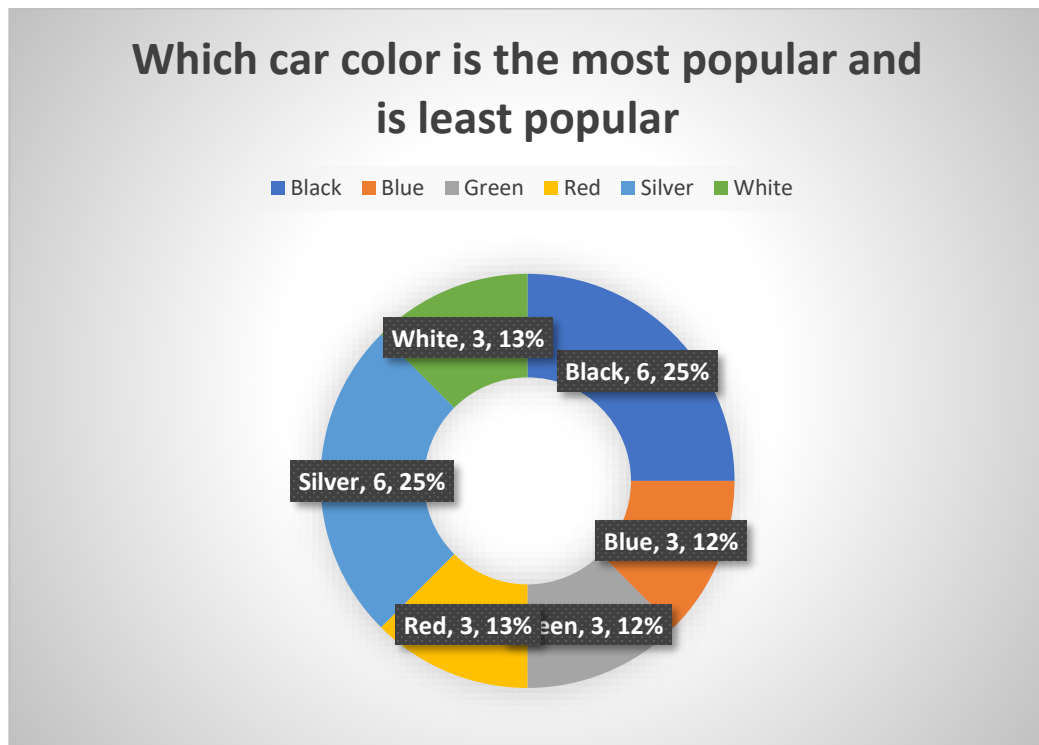

Ans . The Chevrolet Impala has a higher average mileage (114,243 miles) compared to the Toyota Corolla (92,377 miles).

2. Justify, Buying of any Ford car is better than Honda.

Ans. Purchasing a Honda is more beneficial than a Ford, as Honda provides a greater price-cost difference (\$693.6 vs. \$551.6), signifying better value.

3. Among all the cars which car color is the most popular and is least popular?

Ans. The most common colors are Black and Silver, both with 6 cars. The least common colors are Blue, Green, Red, and White, each with 3 cars.

4. Compare all the cars which are of silver color to the green color in terms of Mileage.

Ans. The average mileage for green cars is 78,103.67 miles, while for silver cars it is 63,797.33 miles. Thus, green cars have a higher average mileage compared to silver cars.

5. Find out all the cars, and their total cost which is more than \$2000?

Ans. The following cars exceed a total cost of \$2000: Chevrolet Impala (\$5500), Chevrolet Malibu (\$3000), Chevrolet Silverado (\$4500), Ford Escape (\$6950), Ford F-150 (\$3000), Ford Mustang (\$3100), Honda Accord (\$6500), Honda CRV (\$4100), Nissan Altima (\$5500), and Toyota Corolla (\$6300).

Conclusion and Reviews:-

The used vehicle dataset analysis reveals several insights. Comparing Chevrolet Impala and Toyota Corolla's mileage, Toyota Corolla models have higher mileage, suggesting better fuel efficiency.

The dataset lacks sufficient information to definitively compare Ford and Honda. Factors like vehicle condition, maintenance history, and extra features, which aren't in the dataset, are crucial for determining value.

Black is the most popular car color, while green is the least popular, which could be useful for consumers considering resale value and color demand.

Green cars, such as the Nissan Altima and Chevrolet Silverado, tend to have higher mileage than silver cars like the Honda Accord and Dodge Charger, although mileage can significantly vary based on driving habits and maintenance.

Cars with total costs exceeding \$2,000 include the Honda Accord, Nissan Altima, Toyota Corolla, Chevrolet Silverado, Chevrolet Impala, Chevrolet Malibu, Ford Escape, Ford Mustang, Honda CR-V, Dodge Charger, and Ford Fusion.

Regression

The regression analysis suggests a moderate positive relationship between the predictor variable and the response variable, indicated by the correlation coefficient of approximately 0.40. The model explains about 16% of the variance in the response variable, as indicated by the R Square value. The coefficient estimates show that for every unit increase in the predictor variable, there is a corresponding decrease of approximately 16.66 in the response variable, with a p-value of 0.056, indicating a marginally significant effect.

SUMMARY OUTPUT

Regression Statistics	
Multiple R	0.40404555
R Square	0.1632528
Adjusted R Square	0.1234077
Standard Error	33099.5397
Observations	23

ANOVA					
	<i>df</i>	<i>SS</i>	<i>MS</i>	<i>F</i>	<i>Significance F</i>
Regression	1	4488793099	4488793099	4.09718598	0.05586127
Residual	21	2.3007E+10	1095579531		
Total	22	2.7496E+10			

	<i>Coefficients</i>	<i>Standard Error</i>	<i>t Stat</i>	<i>P-value</i>	<i>Lower 95%</i>	<i>Upper 95%</i>	<i>Lower 95.0%</i>	<i>Upper 95.0%</i>
Intercept	130438.919	23634.1932	5.51907645	1.7789E-05	81288.9236	179588.914	81288.9236	179588.914
3000	-16.664135	8.23265547	-2.0241507	0.05586127	-33.784879	0.45660911	-33.784879	0.45660911

Co-relational

The correlation matrix indicates a moderate negative correlation (-0.411) between Mileage and Price. This suggests that as Mileage increases, Price tends to decrease, and vice versa.

	<i>Mileage</i>	<i>Price</i>
Mileage	1	
Price	-0.4110586	1

Anova: Single Factor

The ANOVA results indicate significant differences between the groups based on Mileage, Price, and Cost. The F-statistic is large (128.88), with a very low p-value (5.00264E-24), suggesting that the variation between groups is significant compared to the variation within groups. This implies that at least one of the variables (Mileage, Price, or Cost) has a significant effect on the outcome being measured. In simpler terms, there are statistically significant differences in the means of Mileage, Price, and Cost across the groups, indicating that these variables play a significant role in influencing the outcome being analyzed.

Anova: Single Factor

SUMMARY

<i>Groups</i>	<i>Count</i>	<i>Sum</i>	<i>Average</i>	<i>Variance</i>
Mileage	24	2011267	83802.7917	1214155660

<u>Total</u>	<u>1.3242E+11</u>	<u>71</u>				

Anova: Two-Factor Without replication

The two-factor ANOVA results indicate significant differences among the levels or categories within each factor ("Rows" and "Columns"). Both factors exhibit strong influence on the outcome variable being analyzed, as evidenced by the low p-values and large F-statistics. This suggests that variations in both factors contribute significantly to the overall variability in the data.

Descriptive Statistics

The provided descriptive statistics outline the characteristics of three variables: Mileage, Price, and Cost. Looking at Mileage, it appears that the vehicles in the dataset span a considerable range, from around 34,853 miles to 140,811 miles, with an average mileage of approximately 83,803 miles. Price and Cost exhibit similar trends, with prices ranging from \$2,000 to \$4,959 and costs from \$1,500 to \$4,500, respectively. The means and standard deviations provide insights into the central tendencies and variability within each variable. Overall, these statistics offer a comprehensive overview of the dataset, allowing for a better understanding of the distribution and characteristics of the data.

Examining Sales by Sector in the United States

Introduction :

Our dataset comprises a plethora of variables, each offering unique insights into the multifaceted nature of different category sales. From fundamental transactional details such as Date, Time, sales, states to more nuanced factors like Customer Type, Demographics, category and sub category, every facet has been meticulously documented.

Key Attributes:

1. ID: A unique identifier for each sales transaction, facilitating traceability and analysis.
2. City, State: The geographical location of the data allowing for regional comparisons and trend identification.
3. Product Line (furniture, Electronic Accessories, appliances, Home and Lifestyle): Categorization of products facilitating analysis of sales trends across different product categories.
4. Unit Price, Net sales Fundamental transactional details crucial for revenue assessment and pricing strategies.
5. Net sales of different category, category performing well in different states: Performance metrics
6. Rating: different product performing well in different state
7. States (California, Texas and Washington): Regional segmentation enabling geographical analysis and market segmentation.

Questionnaire :

1. Compare all the US states in terms of Segment and Sales. Which Segment performed well in all the states?
2. Find out top performing category in all the states?
3. Which segment has most sales in US, California, Texas, and Washington?
4. Compare total and average sales for all different segment?
5. Compare average sales of different category and sub category of all the states.
6. Find out state wise mode for Customer and Segment. California, Illinois, New York, Texas, Waashington

Analytics :

Q1. Compare all the US states in terms of Segment and Sales. Which Segment performed well in all the states?

Ans. Upon comparing sales across all states, California had the highest sales
 The consumer segment had good performance in every state

Q2. Find out top performing category in all the states?

Ans In all states, the Office Supplies category performs the best out of all other categories.

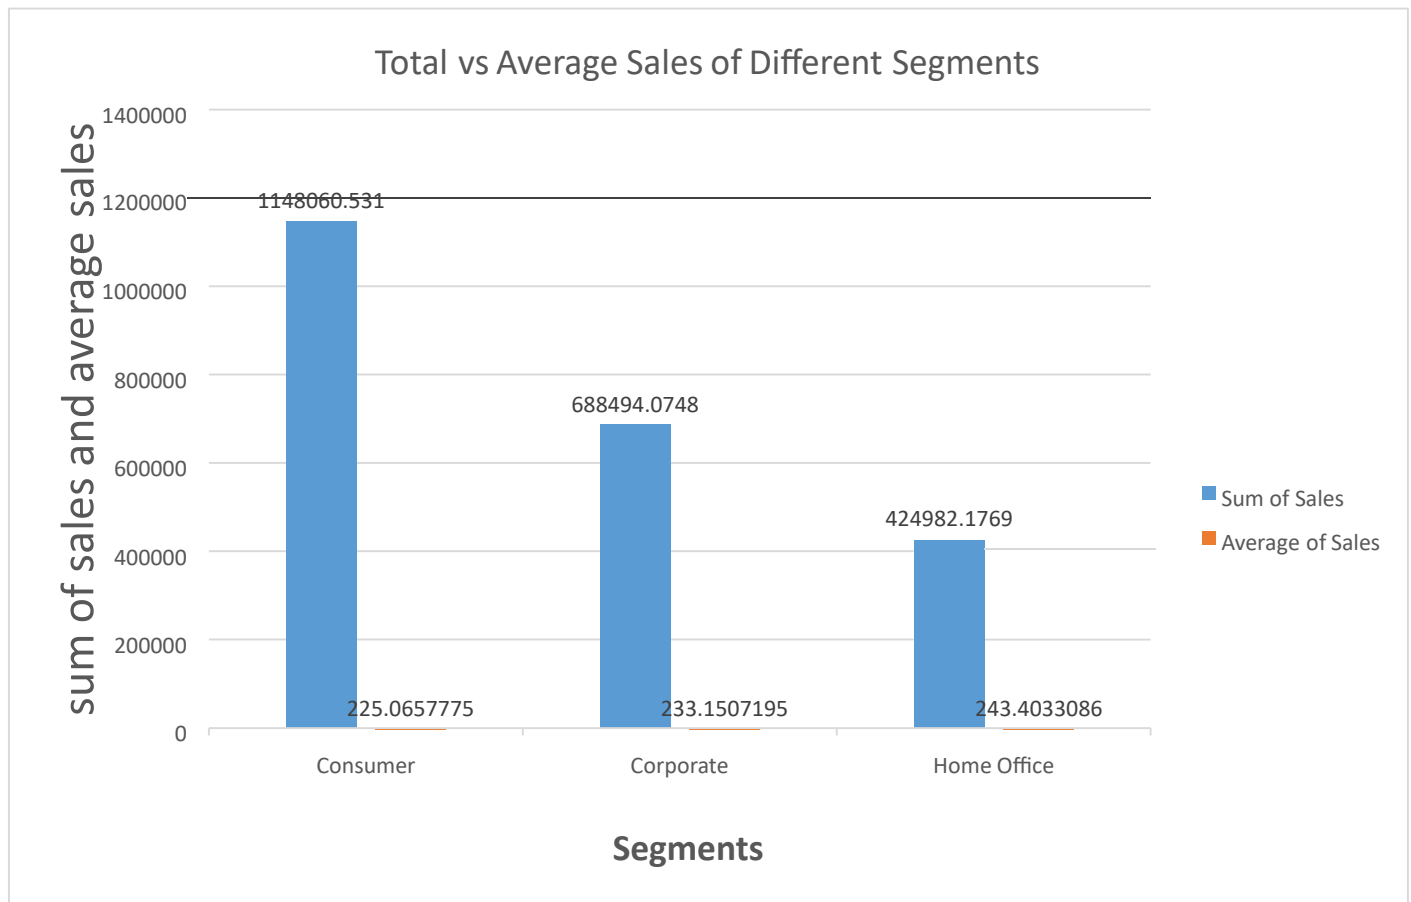

Q3. Which segment has most sales in US, California, Texas, and Washington?

Ans A consumer segment has the most sales in the United States, California, Texas, and Washington. amount of sales in the consumer segment in the US, California, Texas, and Washington

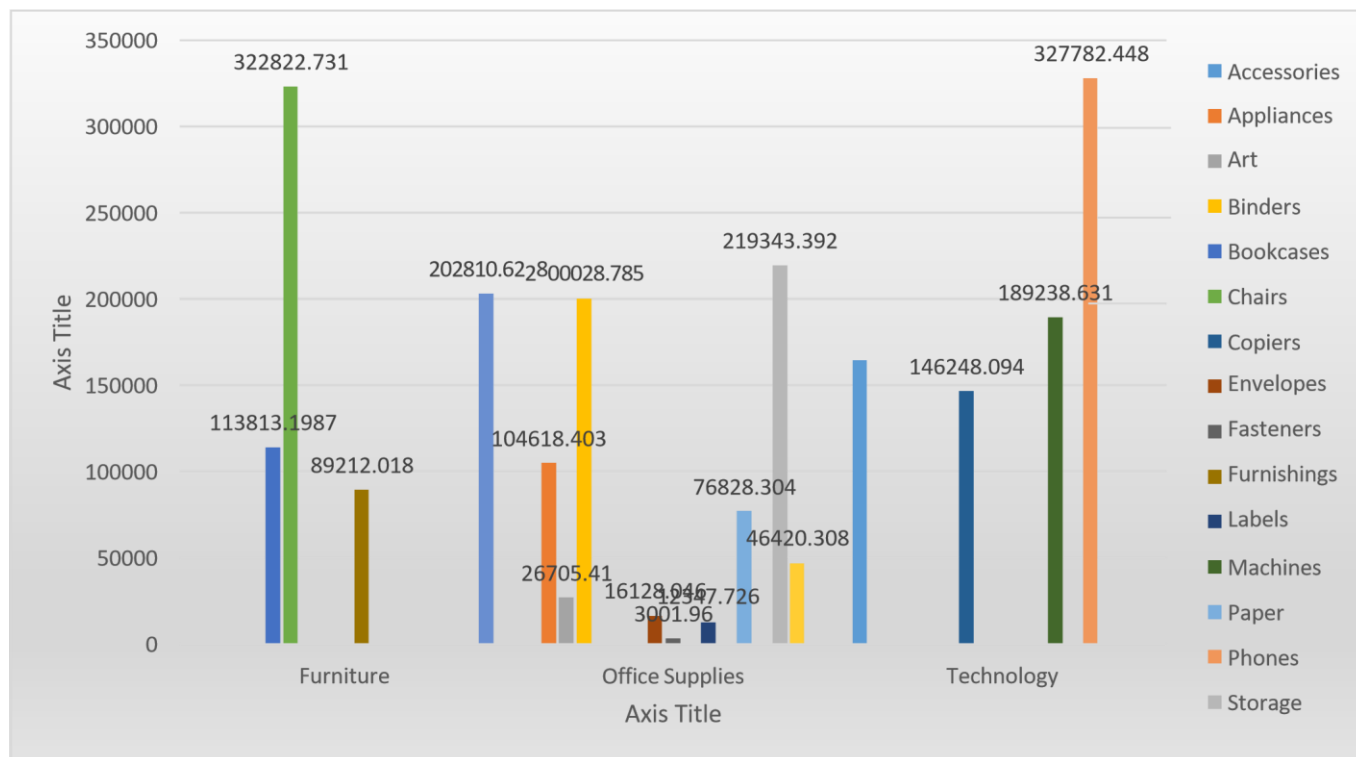

State	Sales
Alabama	0.444
Arizona	0.556
Arkansas	0.836
California	0.852
Colorado	0.876
Connecticut	0.898
Delaware	0.984
District of Columbia	0.99

Q4. Compare total and average sales for all different segment?

Ans. According to the analysis that was carried out on the given data set, it is found that the total sales of all three segments were higher than the average sales of the segments.

Q5. Compare average sales of different category and sub category of all the states.

Ans. Through our examination of the Order Sales dataset, we were able to determine that, as a consequence of our investigation, the average sales of Technology were much greater than the average sales of the remaining categories.

Regression and ANOVA:

Regression	1	27783.3433	27783.3433	0.078106235
Residual	997	354645097.6	355712.2343	
Total	998	354672880.9		

	<i>Coefficients</i>	<i>Standard Error</i>	<i>t Stat</i>	<i>P-value</i>
Intercept	232.3779806	37.2042048	6.246013907	6.22491E-10
Postal Code	0.000167458	0.000599189	0.279474927	0.779938343

This regression analysis aims to examine the relationship between two variables: an independent variable represented by "Postal Code" and a dependent variable (not explicitly mentioned in the output). Here's an explanation of the key components:

1. Regression Equation:

The regression equation is of the form: $Y =$

$$232.38 + 0.000167458 * (\text{Postal Code})$$

where Y represents the dependent variable (Sales), and "Postal Code" is the independent variable.

2. Interpretation of Coefficients:

The intercept coefficient (232.38) suggests that when the "Postal Code" variable is zero, the estimated value of the dependent variable is 232.38. However, the interpretation of this intercept may not be meaningful since postal codes are unlikely to be zero.

The coefficient for "Postal Code" (0.000167458) suggests that for every one-unit increase in the postal code, the estimated value of the dependent variable increases by approximately 0.000167458 units. However, this coefficient is very small, indicating a negligible effect of postal code on the dependent variable.

3. Statistical Significance:

The p-value associated with the coefficient for "Postal Code" is 0.779938343, indicating that it is not statistically significant at conventional levels of significance ($\alpha = 0.05$). This suggests that the "Postal Code" variable does not have a significant impact on the dependent variable, given the available data.

4. Goodness of Fit:

- The R-squared value (0.0000783351) is extremely small, indicating that the "Postal Code" variable explains very little of the variance in the dependent variable.
- The Adjusted R-squared value (-0.000924595) is negative, which can happen when the model is over fit or when the independent variable is not relevant. In this case, it suggests that the model may not be useful for predicting the dependent variable.

5. ANOVA:

- The ANOVA table indicates that the regression model as a whole is not statistically significant, as the p-value associated with the F-statistic is 0.779938343.

6. Standard Error:

- The standard error (596.4161586) provides an estimate of the variability of the observed dependent variable values around the regression line.

7. Observations:

- The analysis is based on a sample of 999 observations.

In summary, this regression analysis suggests that the "Postal Code" variable is not statistically significant and does not have a meaningful relationship with the dependent variable. Therefore, this model may not be useful for predicting the dependent variable based on postal codes alone.

Correlation:

The absolute value of the correlation coefficient (0.024067424) is close to zero. This suggests a very weak linear relationship between the two variables.

Descriptive Statistics:

<i>Sales</i>	
Mean	230.7691
Standard Error	6.33014
Median	54.49
Mode	12.96
Standard Deviation	626.6519
Sample Variance	392692.6
Kurtosis	304.4451
Skewness	12.98348
Range	22638.04
Minimum	0.444
Maximum	22638.48
Sum	2261537
Count	9800

4. CONCLUSION:

Our comprehensive analysis of the dataset, using a variety of data visualization techniques, has yielded significant insights. Through the use of bar graphs, pie charts, and other visual tools, we've uncovered patterns, trends, and relationships within the data that might have otherwise been overlooked.

This detailed exploration of the dataset has not only enhanced our understanding of the information but also enabled us to make informed decisions based on the insights derived. Data visualization has made complex findings clear and accessible, aiding comprehension and facilitating actionable strategies.

Furthermore, this process has underscored the value of data visualization as an effective method for gleaning important information from raw data. By employing graphs and charts, we've turned numbers and statistics into compelling narratives that improve understanding and inform decision-making.

Loan Data Report

Introduction:

Dataset Overview:

Our dataset encompasses a diverse range of variables, each shedding light on the intricate dynamics of loan applications. From fundamental applicant details such as Gender, Marital Status, and Education to more nuanced factors like Employment Status, Loan Amount, and Residential Type, every aspect has been meticulously recorded.

Key Attributes:

1. Gender: A demographic identifier providing insights into the gender distribution among loan applicants.
2. Marital Status (Married, Not Married): Categorization based on marital status aiding in demographic segmentation.
3. Education (Graduate, Non-graduate): Classification based on educational background for further analysis.
4. Employment Status (Employed, Unemployed): Distinction between employed and unemployed applicants, crucial for risk assessment.
5. Loan Amount: The principal amount applied for, providing a measure of financial need and capacity.
6. Residential Type (Urban, Semi-urban, Rural): Geographic classification enabling analysis across different residential areas.

Questionnaire:

- Q1. How many male graduates who are not married applied for Loan? What was the highest amount?
- Q2. How many female graduates who are not married applied for Loan? What was the highest amount?
- Q3. How many male non-graduates who are not married applied for Loan? What was the highest amount?
- Q4. How many female graduates who are married applied for Loan? What was the highest amount?
- Q5. How many male and female who are not married applied for Loan? Compare Urban, Semiurban and rural on the basis of amount.

Analytics:

Q1. How many male graduates who are not married applied for Loan? What was the highest amount?

Ans. There were 66 male graduates who are not married applied for the loan. The highest amount they applied for was \$240.

Q2. How many female graduates who are not married applied for Loan? What was the highest amount?

Ans. There were 35 unmarried female graduates who applied for a loan. The highest amount applied for was \$300.

Q3. How many male non-graduates who are not married applied for Loan? What was the highest amount?

Ans. 16 unmarried male non-graduates have applied for a loan. The maximum amount requested was \$199.

Q4. How many female graduates who are married applied for Loan? What was the highest amount?

Ans. In the latest loan application period, thirty-five unmarried female graduates applied for financial aid. These degree holders needed monetary support, with loan requests ranging up to \$300, the highest amount requested by any graduate during this period.

Q5. How many male and female who are not married applied for Loan? Compare Urban, Semi-urban and rural on the basis of amount.

Male and Female who are not married applied for Loan & Comparison of Urban, Semi-urban and rural on the basis of amount.

Ans. There are 7 unmarried male and 3 unmarried female loan applicants. Urban areas have the highest total loan amount at 15308, followed by rural areas at 5167 and semi-urban areas at 4976.

Conclusion:

Our analysis, employing a range of visualization techniques, unveiled key insights, which improved understanding and decision-making. The visualization of data simplified complex findings, paving the way for implementable strategies. This underscores the crucial role of data visualization in deriving significant insights and guiding effective decisions.

Regression:

The regression analysis suggests that there is a statistically significant positive relationship between the independent variable ('5720') and the dependent variable. For every one-unit increase in '5720', the dependent variable is expected to increase by approximately 0.0059 units. However, it's important to note that the model only accounts for about 21.1% of the total variance in the dependent variable.

CoapplicantIncome -0.110334799 1 LoanAmount 0.458768926
0.144787815 1

Anova (Single Factor) :

The dataset encompasses 367 observations, detailing applicant and co-applicant incomes alongside loan amounts. On average, applicants possess a higher income, averaging around \$4805.60, compared to co-applicants whose average income is approximately \$1569.58. Loan amounts vary widely, averaging \$134.28. ANOVA analysis underscores significant distinctions between the income and loan amounts across the groups, implying diverse financial profiles among applicants and co-applicants.

Shop Sales Data Report

Introduction:

This dataset encapsulates a wealth of information regarding sales transactions, providing valuable insights into the dynamics of retail operations. With columns meticulously crafted to capture key facets of each transaction, including Date, Salesman, Item Name, Company, Quantity, and Amount, analysts and businesses alike gain access to a treasure trove of actionable data.

Whether it's uncovering trends, optimizing inventory management, or refining sales strategies, this dataset serves as an invaluable resource for driving informed decision-making and unlocking new avenues for growth.

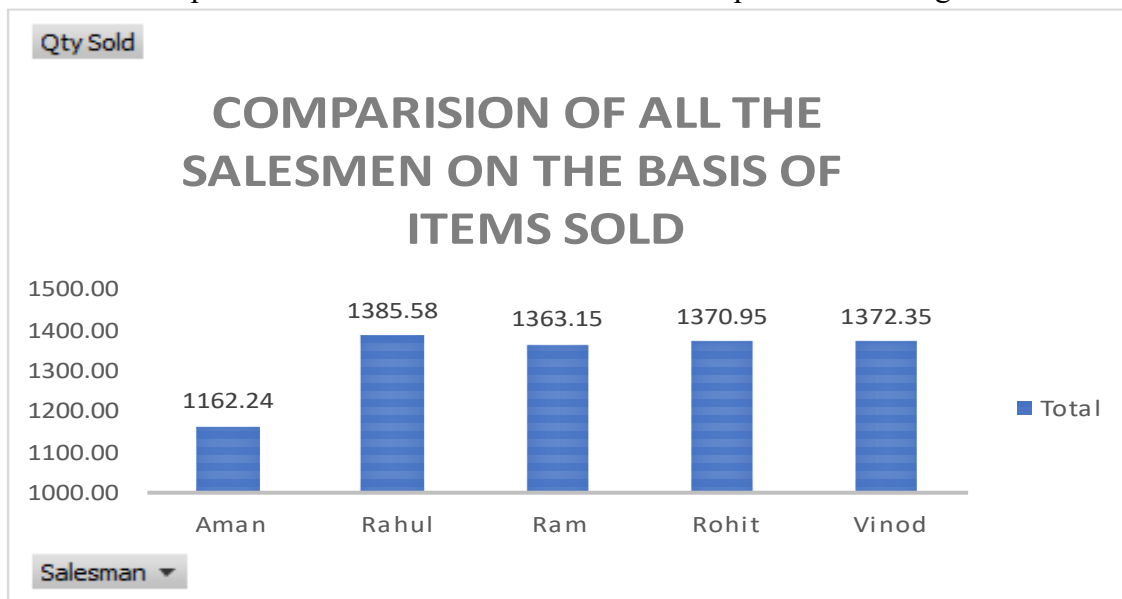

Questionnaire:

1. Compare all the salesmen on the basis of profit earn.
2. Find out most sold product over the period of May-September.
3. Find out which of the two product sold the most over the year Computer or Laptop?
4. Which item yield most average profit?
5. Find out average sales of all the products and compare them.

Analytics:

1. Compare all the salesmen on the basis of profit earn.

Ans. The comparison of all the salesmen on the basis of profit earned is given below:

2. Find out most sold product over the period of May-September.

Ans. To determine the most sold product from May to September, we should analyze the sales data for this period. This involves aggregating the quantity sold for each product across all transactions. The product with the highest total quantity sold will be the most popular item.

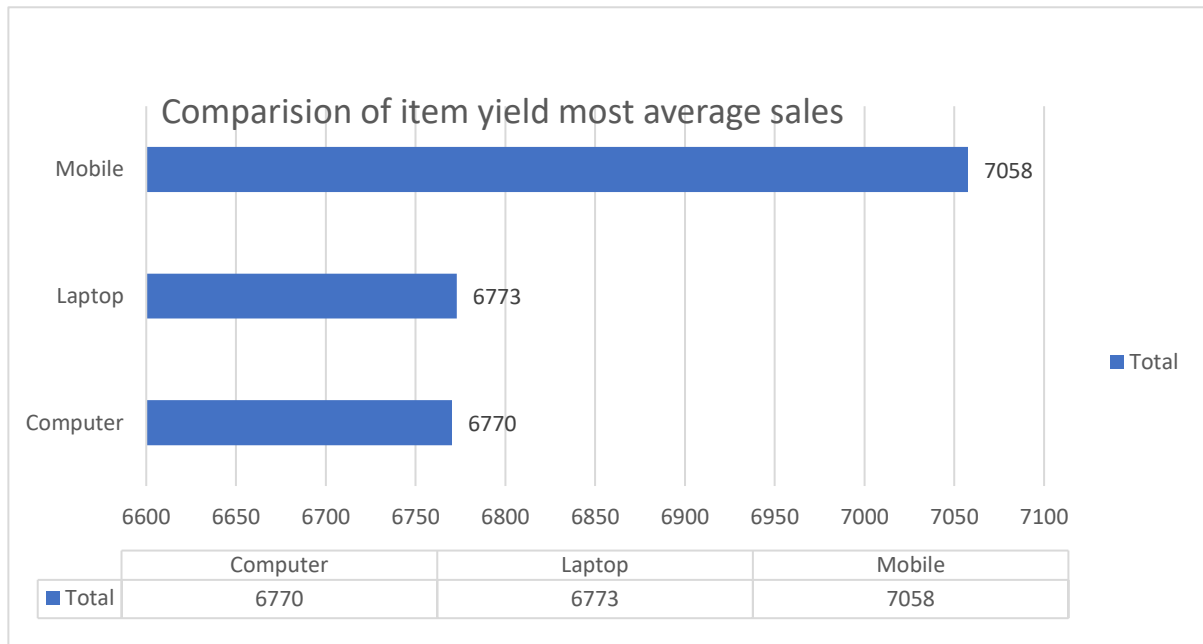

3. Find out which of the two product sold the most over the year Computer or Laptop?

Ans:- The two product sold the most over the year between computer or laptop :

4 . Which item yield most average profit?

Ans:- The item that yields the most profit between laptop, computer and mobile is :

5. Find out average sales of all the products and compare them.

Ans:- The average sales of all the products with their respective comparison is :

Conclusion and Review :

The shop sales dataset provides insights into sales trends, salesman performance, item popularity, and company performance. Analyzing this data can guide strategic decisions and enhance sales strategies.

The dataset is well-structured and provides comprehensive information on sales transactions. It allows for various analyses, but could benefit from additional variables for deeper insights. Overall, it's a valuable resource for understanding sales dynamics and informing business decisions.

Regression:

The regression model, with a significant p-value indicates a strong positive relationship between Amount and the profit earned and the outcome variable. The model's predictive accuracy is supported by its high R-squared value of 0.660.

SUMMARY OUTPUT

Sales Data Samples Report

Introduction:

In the realm of business analytics, a dataset encompassing sales transactions emerges as a vital asset for deriving actionable insights. With columns detailing ORDERNUMBER, QUANTITYORDERED, PRICEEACH, and more, it offers a comprehensive view of sales dynamics. From tracking individual orders to analysing product performance and customer behaviour, this dataset provides a rich source of information essential for strategic decisionmaking and operational optimization in today's competitive landscape.

Questionnaire:

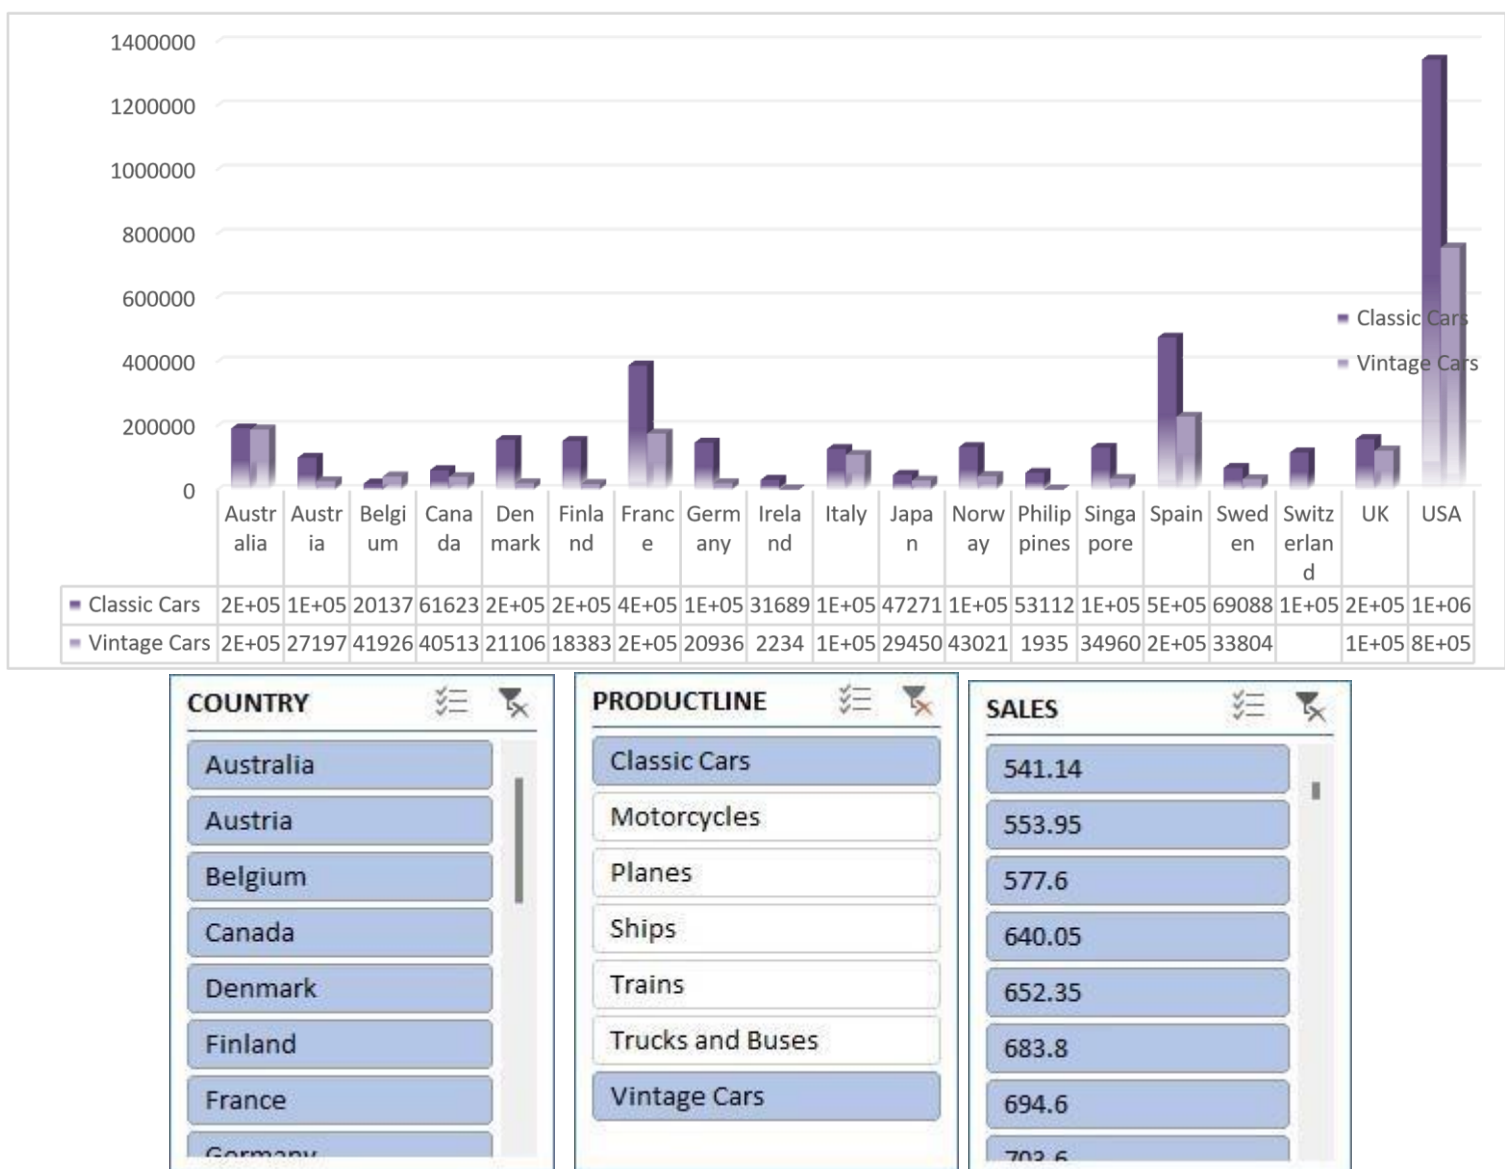

1. Compare the sale of Vintage cars and Classic cars for all the countries.
2. Find out average sales of all the products? which product yield most sale?

3. Which country yields most of the profit for Motorcycles, Trucks and buses?
4. Compare sales of all the items for the years of 2004, 2005.
5. Compare all the countries based on deal size.

Analytics:

1. Compare the sale of Vintage cars and Classic cars for all the countries.

Ans:-The comparison of sale of Vintage cars and Classic cars for all the countries is given below:-

2. Find out average sales of all the products? which product yield most sale?

Ans:

5. Compare all the countries based on deal size.

Ans. The comparison of all the countries based on deal size are:

Regression and Anova

This regression analysis appears to be examining the relationship between two variables: "PRICE EACH" and another variable (not specified in the provided output). Here are the results:

1. **Regression Equation:** The regression equation can be written as: $Y = -1470.59 + 60.06X$ where:

- Y represents the dependent variable Quantity.
- X represents the independent variable "PRICE EACH".

2. **Interpretation of Coefficients:**

- The intercept coefficient (-1470.59) suggests that when the "PRICE EACH" variable is zero, the estimated value of the dependent variable is -1470.59. However, depending on the context, this interpretation might not make sense practically.

- The coefficient for "PRICE EACH" (60.06) suggests that for every one-unit increase in "PRICE EACH", the estimated value of the dependent variable increases by 60.06 units.

3. Statistical Significance:

- The p-value associated with the coefficient for "PRICE EACH" is 0.00, indicating that the coefficient is statistically significant at conventional levels of significance (typically $\alpha=0.05$).
- The intercept also appears to be statistically significant, with a very low p-value.

4. Goodness of Fit:

- The R-squared value (0.433) indicates that approximately 43.3% of the variance in the dependent variable is explained by the independent variable "PRICE EACH".
- The adjusted R-squared value (0.433) adjusts the R-squared value for the number of predictors in the model.

5. ANOVA:

- The ANOVA table indicates that the regression model as a whole is statistically significant, as the p-value associated with the F-statistic is 0.00.

6. Standard Error:

- The standard error (1387.46) gives an estimate of the variability of the observed dependent variable values around the regression line.

7. Observations:

- The analysis is based on a sample of 2823 observations.

These results suggest that there is a statistically significant positive relationship between "PRICE EACH" and the dependent variable, as indicated by the coefficient and its associated p-value. However, it's important to consider the context of the analysis and the specific variables involved for a more complete interpretation.

CORRELATION:

The correlation coefficient you calculated (0.657840928) represents the strength. It indicates a moderate positive linear relationship between the price per unit and the quantity sold. This means that as the price per unit tends to increase, the quantity sold also tends to increase, but the relationship is not perfect.

Descriptive Statistics:

SALES

Mean	3553.889072
Standard Error	34.66589212
Median	3184.8
Mode	3003
Standard Deviation	1841.865106

Conclusion and Review:

In conclusion, the analysis of the provided sales dataset offers a window into the intricacies of business operations, shedding light on customer preferences, product performance, and market trends. By leveraging the insights gleaned from this dataset, businesses can make informed decisions, streamline processes, and drive growth. As the landscape of data analytics continues to evolve, harnessing the power of such datasets remains instrumental in staying competitive and responsive to the ever-changing demands of the market.
